ABSTRACT

Apparatus, and an associated method, for selectably deleting contents stored at a dictionary device of a sending or receiving entity. The dictionary device stores content representative of indicia associated with SIP, or other, signal protocol messages

5   generated during operation of a communication system. A selector selects portions of the contents stored at the dictionary device to be deleted, thereby to permit additional content to be stored at the dictionary device. When separate dictionary devices are positioned at sending and receiving entities, implicit synchronous operation of selection of deletion of content at the separate dictionary devices is effectuated synchronously, but implicitly.
